

Dear Distinguished Members of the Public Health Committee,

I am writing in reference to SB858 and ask that you please support me by killing this bill. Parents and guardians are sole decision makers as to what, where and when a child receive any vaccines and medication.

I see this as a clear violation of family rights and human rights. Parents have responsibility for the welfare of their children not the state. What happens when parents do not know what has been given hours, days or weeks later when a child has a reaction to the injected vaccine or medication that is administered without informing parents and obtaining their consent?

A 12 year old does not have the ability to process or read Vaccine Information Statements (VIS) that is required by law to be given to the parent/guardian of a minor child. How can a 12 year old, for example, receive full knowledge when they clearly are not mature enough to read, process, think in terms of long term ramifications or risk based on their personal and familial medical history? What did you know at 12 about medical history or adjuvants or heavy metals?

This bill does not take into consideration families, especially religious, who are teaching abstinence and now we have state personnel telling our children that they can get a shot to protect them from cancer if they have sex. This is not acceptable. We are teaching our children healthy and mature responsibility towards themselves and others.

We know that the **US Supreme Court has ruled that vaccines are “unavoidably unsafe” and carry known documented risk.** We as parents would never subject our children to known potential risks that could cause harm without doing our own due diligence to properly assess risk/benefits.

The HPV vaccine has never been proven in any clinical trials to prevent cervical cancer when it went through the 6 month fast track FDA process. Remember Merck needed a drug to make up for the shortfall of the Vioxx fiasco to their bottom line. Remember Vioxx? Yes, we parents remember the fraud of Merck but our 12 year old does not. There was never a true placebo with an inert solution given. As a matter of fact their documentation showed the removal of participants in their "clinical trial" when participants had serious adverse reactions like dying. Women are protected by having annual pap smears and changes in lifestyle because 95% of HPV infections are removed by the body naturally and only 1.5 per 100,000 women are at risk of precancerous cells due to the presence of HPV 16 and 18 viruses which could progress to cervical cancer. (source listed at end of email)

Did you know that GARDASIL **has not been evaluated for the potential to cause carcinogenicity or genotoxicity** (per the vaccine insert)? Actually there isn't one vaccine that has been studied/tested for carcinogenicity or genotoxicity or mutagenesis. The alleged testing on male rats for sperm impact does not speak to offspring of the rats and does not show human results so I would need to see further studies on human reproduction and fertility. Currently there are studies showing our young adults and college age children have the lowest fertility rates with 1:6 not being able to conceive. <https://vactruth.com/?s=fertility+issues> There are NO vaccine studies showing no adverse effects to fertility so why would we trust that this one does not negatively effect our children and their ability to conceive?

As of December 2018, there are over 60,000 reported adverse events - this is both male and female — associated with the HPV vaccine with over 450 death and additional 2800 permanent disabled (vaers.hhs.gov). This vaccine was “fast tracked” and we as parents are seeing the results. According to a study commissioned by the CDC, Harvard determined that only 1-10% of vaccine reactions are reported because the medical field has been trained that vaccines are safe and effective.

Rather than remove parental rights, instead, parents and elected officials should practice the precautionary principle. The Precautionary Principle is defined as follows:

- If there is a reasonable possibility that a substance may cause harm then there should be a presumption that it will, and therefore exposure to that substance should be minimized.

Japan has completely removed the HPV vaccine from their list of recommended vaccines due to short term and long term health concerns— It appears Japan actually cares about their people and future generation. In addition the current lawsuit regarding Gardasil is moving forward <https://childrenshealthdefense.org/news/court-hears-gardasil-science-and-moves-forward/>

Listen to one documentary of real people who trusted the HPV vaccine: https://youtu.be/_NaHH626_aQ

I ask respectfully again, to kill this bill and start working on real issues of removing Wifi in schools and reducing cell towers near our children. These man made radiation devices are hurting our children and our future generation. We ranked the worst country in cognition, memory and problem solving and second from last for math skills out of 24 countries study though we spend the most on technology. Please consider looking at how technology in schools is damaging our children rather than removing parental rights.

Our human and parental rights are at risk with bills such as this. Please stay on task — get the economy working and leave our families alone.

In addition to the links above I encourage you to go to sanevax.org for detailed accounts, research and reports on the current nationwide status of the HPV vaccine.

It is important that our rights as parents are not trampled upon and no one should ever mandate any medical procedure or injection or medication when there is risk to a minor without full informed consent and a minor cannot give that.
